Performance Goal No.:			
Performance Goal Text:			

Task Description:	This project is a focused study of human factors, behavior, and performance issues during expeditions to the International Space Station (ISS). The objective of the study is to obtain behavioral and human factors data from a systematic analysis of astronaut journals maintained during ISS increments. The investigator has studied conditions analogous to space craft in previous projects, including a two-year study (conducted for NASA with the cooperation of ESA and the French Polar Institute) in which content analyses were performed of diaries maintained by the station leaders and physicians at French Antarctic and South Indian Ocean remote duty stations. That study provided the first rank-ordering of the behavioral issues associated with isolation and confinement, based on quantitative data. In the current project, ISS crew will maintain personal journals for subsequent review and content analysis. ISS expeditions provide unique research opportunities; this study represents the next logical step in the research program.
Rationale for HRP Directed Research:	
Research Impact/Earth Benefits:	Astronauts have reported that participating in the Journals Experiment has helped them adapt to the isolation, confinement, and other special conditions of the ISS.
Task Progress:	Five of the first six participants in the experiment maintained their personal journals throughout their six-month expeditions to the ISS and exceeded the minimum commitment to frequency, volume, and candor of their entries. The current subject also is participating fully in the experiment by making frequent and candid entries in his electronic journal.
