Performance Goal No.:			
Performance Goal Text:			
Task Description:	The diagnosis and management of acute health problems in space is problematic due to limited training of the Crew Medical Officer (CMO), human and environmental factors, and a lack of reference of the changes in anatomy, disease presentation, and therapy in micro-gravity. There is no planned radiological capability aboard the ISS further complicating medical diagnosis in space. Recent terrestrial investigations suggest expanded clinical applications of ultrasound and laparoscopy with miniature instrumentation which have applicability for aerospace medicine. This proposal will initially determine the diagnostic utility of ultrasound and/or micro-laparoscopy in select health contingencies with high potential mission impact. These diagnostic modalities will then be used to facilitate minimally invasive, definitive surgical therapy of selected contingencies in animal models in ground based and simulated micro-gravity scenarios. Optimal just-in-time training regimens and computer based refresher modules for non-physician CMO's to accomplish these tasks will be developed. The unique constraints imposed by training and equipment limitations and the space environment require the development of novel diagnostic and therapeutic strategies for crew		

	member health problems including the expansion of ultrasound and mini-laparoscopy. Thoracic ultrasound, initially investigated by NASA as an alternative diagnostic modality for pneumothorax, has proven accuracy in terrestrial and micro-gravity applications and will have wide spread impact in acute care on Earth in the future. Although some of the techniques investigated in this proposal are appropriate only for a micro-gravity environment, the majority of the diagnostic and therapeutic algorithms are readily transferable to terrestrial medicine including rural and military applications. The expanded use of the diagnostic and training modalities described in this proposal, if verified, would provide a significant, clinically relevant advance in space medical capabilities with profound Earth-based ramifications.
Rationale for HRP Directed Research:	
Research Impact/Earth Benefits:	The unique constraints imposed by training and equipment limitations and the space environment require the development of novel diagnostic and therapeutic strategies for crew member health problems including the expansion of ultrasound and mini-laparoscopy. Thoracic ultrasound, initially investigated by NASA as an alternative diagnostic modality for pneumothorax, has proven accuracy in terrestrial and micro-gravity applications and will have wide spread impact in acute care on Earth in the future. Although some of the techniques investigated in this proposal are appropriate only for a micro-gravity environment, the majority of the diagnostic and therapeutic algorithms are readily transferable to terrestrial medicine including rural and military applications. The expanded use of the diagnostic and training modalities described in this proposal, if verified, would provide a significant, clinically relevant advance in space medical capabilities with profound Earth-based ramifications. We completed an outreach trial of our remote guidance paradigms with the Detroit Red Wing Hockey players. The Red Wing athletic personnel recieved just in time training on ultrasound and were remotely guided to perform musculoskeletal ultrasound on injured players. The operators were able to perform these evaluations with high accuracy. The techniques have also been modified for the Detroit Tigers Baseball Team, Detroit Lions, Wayne State University School of Medicine, and the United States Olympic Committee for Olympic Athletes.
Task Progress:	We have completed Pre-flight training and in-flight experiments on the ISS increment 10 and 11 crews and have completed post flight data acquisition on I 11 after landing. We have done numerous outreach activities with high school students and astronauts which have resulted in 2 publications to date. We are currently working with the Detroit Tigers, Detroit Red Wings, Detroit Lions, and United States Olympic Committee to modify our NSBRI developed training methodologies for use in these sporting arenas. We have completed preliminary ground investigations for microgravity flights on the new NASA research facility, and have completed a C9 flight comparing ultrasound with microlaparoscopy and have another set of experiments to evaluate cardiovascular ultrasound in September. We are completing data analysis and publications on the previous years investigations. We will support the NSBRI users group in October and helped introduce Leroy Chiao to the NSBRI organization.
