Grant/Contract No.:	JPL 1459238		
Performance Goal No.:			
Performance Goal Text:			

Task Description:	ACES (Atomic Clock Ensemble in Space) is a European Space Agency (ESA) project that will test fundamental physics, search for the time variation of fundamental constants, and enable highly precise frequency comparisons between clocks on Earth. It is planned to operate for at least 18 months on the International Space Station. PHARAO (Projet d'Horloge Atomique par Refroidissement d'Atomes en Orbit) is the laser-cooled, microgravity, atomic cesium clock of ACES that provides state-of-the-art accuracy, with a goal of 1 part in 10^(16) accuracy. We will assist in the accuracy evaluation of PHARAO, a central scientific objective of the ESA mission. We will contribute to the analysis of the three largest sources of systematic uncertainty: clock frequency shifts due to the collisions of ultracold atoms, a Doppler shift known as the distributed cavity phase shift, and a frequency shift due to the lensing of the atomic wavepackets by the clock's microwave field. The initial working uncertainty budget projected an accuracy of 2.2×10^(-16). The proposed work will reduce the largest contribution to the clock's uncertainty to negligible levels and investigate significant reductions of others, with a goal of reaching 10^(-16) accuracy. The work will help define the limits of PHARAO's accuracy and identify workable procedures to demonstrate its accuracy. The PI will also participate in a study on space optical clocks as a member of NASA's science definition team (SDT) for optical clocks and time transfer.
Rationale for HRP Directed Research:	
Research Impact/Earth Benefits:	Our work on microwave cavities produced an improved design that will be used for Cs and Rb fountain clocks. These are being incorporated into new clocks at the British, Canadian, South Korean, Polish, and Indian National Laboratories, and at CERN. The new cavity design allows significantly reduced clock errors due to Doppler shifts. Our work has also led to a deeper understanding of the microwave lensing frequency shift that is being used as a correction of International Atomic Time, including the correction for the PHARAO clock. More broadly, our work contributes to scientific progress towards anticipated future optical frequency atomic clocks, including testing fundamental physics with state-of-the-art optical clocks in space.
Task Progress:	The launch date of the ACES mission is currently set for 2025. In late 2020, a pre-launch accuracy evaluation of the PHARAO clock was published, which completed the bulk of the Pennsylvania State University (Penn State) work expected before launch. The Penn State group continues their contact with the PHARAO and ACES teams to address any issues that may arise, and maintains their software for PHARAO, for the reaming work to establish the PHARAO clock accuracy once in orbit. Additional work this year is expected on clarifying the uncertainty of the important velocity and density extrapolation for PHARAO. As a member of the NASA science definition team (SDT) for optical clocks and time transfer, the Penn State Principal Investigator (PI) Gibble continued to participate in the development of the FOCOS mission concept. A paper on Fundamental physics with an Optical Clock Orbiting in Space (FOCOS) was published in Quantum Science and Technology. [Ed. Note: See Bibliography.] Gibble is to present a talk on FOCOS at the 2023 NASA Fundamental Physics Workshop (May 23-25, 2023 in Santa Barbara, California). Gibble participated in the European Community Workshop on Cold Atoms in Space, which produced a paper published in the European Journal of Physics.
