Performance Goal No.:	
Performance Goal Text:	
Task Description:	Spaceflight imposes a unique set of stressors on astronauts as a result of mechanical unloading due to microgravity conditions, while tissues are bombarded by galactic and solar radiation. The cardiovascular system is adversely affected by the disuse and fluid shifts that occur with spaceflight. However, there is a growing concern that cardiovascular disease may be substantially elevated during spaceflight. Indeed, increasing evidence indicates that radiation exposure causes damage and fibrosis in the heart and vasculature. Cellular mechanisms of dysfunction due to disuse and space radiation include increased oxidative stress, pro-inflammatory signaling, and impaired function. Heart, vasculature, and the musculoskeletal system will be exposed to gamma and heavy ion (HZE) radiation. Mitochondria, lysosomes, and nucleic acids are particularly susceptible to HZE and secondary oxidant-induced damage. Previous findings and preliminary data from our laboratory indicate that oxidative stress contributes to apoptosis and fibrosis in aging heart models. However, the contribution by which space radiation (X-Ray, HZE) contributes to secondary oxidative stress and fibrosis in the heart are not well understood. We argue that space radiation induced acceleration of the aging process in heart and skeletal muscle, where susceptibility to fibrosis and apoptosis is high. New studies and Preliminary Data from our laboratory suggest that the renin-angiotensin signaling (RAS) are significant sources of oxidative stress, and thus pro-fibrotic signaling in the heart. Upregulation of RAS in the aging heart upregulates the Nox2 isoform of NADPH oxidase. We have also recently found that Nox2 contributes to oxidative stress and atrophy during ground-based spaceflight of skeletal muscle. Thus secondary and amplified oxidative stress may damage nuclei and stimulate pro-fibrotic signaling, including TGF-ß, smad2/3 phosphorylation, and collagen I accumulation. The current RFA research emphasis in Space Biology Tissue Sharing provides an opportunity to promote sharing of samples with ongoing and archived studies. We will propose a series of studies with X-Ray, HZE, and X-Ray + HZE radiation. Collaboration with Dr. Nancy Turner's laboratory at Texas A&M University will focus on two sets of radiation studies. The first cohort of studies will use X-Ray radiation (0.5 Gy) to induce damage and oxidative stress. Mouse (astronaut age) heart samples will be taken 12 hours, or 4 or 8 weeks after exposure. In the second set of experiments, mice will be exposed to 28Si and 48Ti (0.5 Gy). Mice will be sacrificed and tissues extracted 12 hrs, 4 wks, or 8 wks after radiation exposure. Efficacy of an intervention of fish oil + pectin in reducing cardiac fibrotic signaling will be tested. Fish oil reduces oxidative stress and cardiovascular disease, increases protective heat shock proteins. Our Preliminary Data reveal that fish oil + curcumin also reduces muscle atrophy. Dietary pectin ingestion reduces oxidative stress and apoptosis. Pectin and fish oil have also reduced radiation-induced tissue fibrosis in the kidney and liver, respectively. However, the effects on the irradiated heart are unknown. p53 contributes to apoptosis, cardiac fibrosis, and muscle atrophy. We will also query archived cardiac samples irradiated at the Brookhaven National Laboratory involved in combined X-Ray and 56Fe radiation, where mice with a single p53 allele deletion and wild-types were irradiated.
Rationale for HRP Directed Research:	
	The cardiovascular system experiences a number of dynamic changes during spaceflight that impair function and predispose it to chronic disease. When space missions travel beyond the protection of the Van Allen belts the hearts and vasculature of astronauts are subject to the profound stressors of both microgravity and radiation from solar and galactic sources. Mechanical unloading of the musculoskeletal system due to microgravity results in severe disuse, eliciting "detraining" of the heart. In addition, a fluid shift toward central blood volume during microgravity results in elevated right atrial pressure and thus elimination of plasma volume via diuresis. Atrial naturietic factor (ANF) and the renin-angiotensin II pathway are involved in increased renal excretion of water. Spaceflight appears to elicit morphological (e.g., collagen fibrosis) and functional changes of the heart that could impede performance, lead to fatigue and orthostatic hypotension upon re-entry to a gravitational environment, and increase the risk of heart and vascular disease. In addition, disuse that occurs with microgravity may predispose the heart to arrhythmias (Moffitt et al. 2013). Radiation enhances apoptosis and loss of myocytes as well as accumulation of collagenous tissue, or "fibrosis." The average age of a typical astronaut has increased to over 50 years of age, and progressive age increases oxidative stress in the heart (Kwak et al. 2006). Spaceflight imposes a unique set of stressors on astronauts as a result of the loss of gravity during spaceflight, while tissues are bombarded by galactic and solar radiation. The cardiovascular system is adversely affected by the disuse and fluid shifts that occur with spaceflight. However, there is a growing concern that cardiovascular disease may be substantially elevated during spaceflight. Indeed, increasing evidence indicates that radiation exposure causes damage and fibrosis in the heart and vasculature. Weightlessness and space radiation during long-duration spaceflight, particularly in outer space between the Earth and the moon or Mars, increases inflammation and oxidative stress in the heart, vasculature, and muscles, joints, and bones. The body is exposed to X-ray and heavy ion (HZE) radiation that damages cell components such as mitochondria, nuclei, and the cell membrane through increase release of oxidants (i.e., oxidative stress). Astronaut age has increased into the 50s, and thus has the risk of damage, cell death, and fibrotic connective tissue, as published by our laboratory and other scientists. However, the contribution by which space radiation (X-Ray, HZE) contributes to secondary oxidative stress and fibrosis in the heart is poorly understood. We argue that space radiation accelerated the aging process in heart and skeletal muscle, increased fibrosis, and contributed to cell death. New publications and pilot data from our laboratories indicate that a potential source of oxidative stress in the heart during radiation is called the renin-angiotensin system (RAS). RAS can trigger the assembly of NADPH oxidase-2 (Nox2), a cluster of proteins that produces oxidative stress. We recently found that Nox-2 is elevated in a ground spaceflight analog in skeletal muscle and heart, and contributed directly to changes in muscle cell size, shape, and infiltration of connective tissue. Antioxidant compounds and nutritional supplement choices that are based upon causal studies may have alleviated changes in the heart, vasculature, and skeletal muscle with spaceflight. For example, fish oil reduces oxidative stress, and thus increases protective heat shock proteins, and reduces cardiovascular disease. For

example, a combination of fish oil and curcumin recently prevented muscle fiber atrophy and increased protective stress response proteins in a spaceflight analog. Dietary pectin ingestion reduces oxidative stress and cell death. Pectin and fish oil have also reduced radiation-induced tissue fibrosis in the kidney and liver, respectively. However, the effects on the irradiated heart are unknown. We propose to determine the effects of a combination of fish oil and pectin on heavy ion-induced radiation in the heart.

The current RFA research emphasis in Space Biology Tissue Sharing provides an opportunity to promote sharing of samples with ongoing and archived studies. We are conducting a series of studies with X-Ray, HZE, and X-Ray + HZE radiation. Collaboration with Dr. Nancy Turner's laboratory at Texas A&M University focuses on two sets of radiation studies. The first cohort of studies will use X-Ray radiation (0.5 Gy) to induce damage and oxidative stress. Mouse (astronaut age) heart samples will be taken 12 hours, or 4 or 8 weeks after exposure. In the second set of experiments, mice will be exposed to 28Si and 48Ti (0.5 Gy). Mice were sacrificed and tissues extracted 12 hrs, 4 wks, or 8 wks after radiation exposure. Effectiveness of fish oil + pectin in reducing heart damage and fibrosis is being tested. Our Preliminary Data reveal that fish oil + curcumin also reduces muscle atrophy. A protein called p53 also contributes to cell death, fibrosis of the heart, and muscle atrophy. We will thus also query archived cardiac samples irradiated at the Brookhaven National Laboratory. We will also query archived cardiac samples irradiated at the Brookhaven National Laboratory involving combined X-Ray and HZE radiation, where mice with a single p53 allele deletion were irradiated.

Task Progress:	Space exploration presents formidable obstacles for astronauts, chiefly stemming from the absence of gravitational forces and continual exposure to space radiation (e.g., galactic, solar). Cardiovascular, musculoskeletal, and central nervous systems are adversely affected by spaceflight, particularly due to reduced mechanical loading and redistribution of blood flow and hydrostatic pressure during periods of microgravity. In addition, exposure to gamma rays and heavy ion (HZE) radiation during space missions can lead to damage, fibrosis, and structural alterations in cardiovascular tissues, resulting in an increased risk of cardiovascular disease. Furthermore, microbiome function and crosstalk with cardiovascular tissues are also impacted by microgravity and radiation. Oxidative stress and pro-inflammatory signaling can increase cardiac remodeling and heightened cardiovascular disease risk during spaceflight. Previous studies have utilized a combination of fish oil and pectin to demonstrate its efficacy in ameliorating radiation-induced disruption to the microbiota, cardiac fibrotic signaling, and muscle damage resulting from space radiation. Acute 0.5 Gy exposures were used. Astronaut-age (40-42 weeks) mice were divided into four groups (n=6/group): Controls (CON), Controls with pectin + fish oil (CONF), X-ray irradiation (RAD), and X-ray irradiation with pectin + fish oil (RADF). Four weeks following exposure to radiation, mice were euthanized, and their hearts were collected after radiation treatment. The cardiac tissue was carefully dissected, frozen in liquid N2, and prepared for subsequent analysis. The outcomes demonstrate that there was no statistically significant disparity in heart weight observed among the studied groups. To evaluate indicators of damage and inflammation, western blot analysis was employed. The combination of pectin and fish oil exhibited a partial reduction in damage markers (e.g., IgG), inflammatory indicators (e.g., CD68+ and CD8+), and fibrotic signaling (e.g., TGF-β1) in the cardiac tissue exposed to X-ray radiation. Further investigation into oxidative stress, inflammation, and damage is presently ongoing.

Abstracts for Journals and Proceedings	Kamal KY, Hord JM, Wu C, Talcott S., Gomes MJ, Fluckey JF, Ford JF, Turner ND, Lawler JM. "Combination Nutrition Interventions Against Spaceflight Sarcopenia. " 2022 NASA Human Research Program Investigators' Workshop, virtual, February 7-10, 2022. Abstracts. 2022 NASA Human Research Program Investigators' Workshop, virtual, February 7-10, 2022. , Feb-2022
Articles in Peer-reviewed Journals	Lawler J, Kim J, Othman M, Kamal K, Fluckey J. "The sirtuin-1 agonist SRT2104 mitigates redox signaling and nNOS translocation in unloaded skeletal muscle." Physiology. 2025 May 12;40(S1):1343. https://journals.physiology.org/doi/abs/10.1152/physiol.2025.40.S1.1343 , May-2025
Articles in Peer-reviewed Journals	Othman M, Kim J, Kamal K, Lawler J. "RANKL elevation contributes to skeletal muscle myopathy in aging: Unveiling of novel mechanisms." Physiology. 2025 May 12;40(S1):0567. https://journals.physiology.org/doi/abs/10.1152/physiol.2025.40.S1.0567 , May-2025
Articles in Peer-reviewed Journals	Lawler JM, Botchlett RE, Woo SL, Xu H, Li H, Hord JM, Fluckey JD, Kamal K, Wu C. "Metformin ablates high fat diet-induced skeletal muscle hypertrophy and elevation of sarcolemmal GLUT4 when feeding is initiated in young adult male mice." Connect Tissue Res. 2025 Mar;66(2):121-135. https://doi.org/10.1080/03008207.2025.2471853 ; PMID: 40052722 , Mar-2025
Articles in Peer-reviewed Journals	Mason CE, Green J, Adamopoulos KI, Afshin EE, Baechle JJ, Basner M, Bailey SM, Borg J, Borg J, Broddrick JT, Burke M, Caicedo A, Castaneda V, Chatterjee S, Church G, Costes SV, Desai RI, Dhir R, Diaz JE, Etlin SM, Furman D, Garcia-Medina JS, Giacomello S, Gupta A, Hassanin A, Houerbi N, Irby I, Jirak P, Jones CW, Kamal K, Kangas BD, Kim J, Kim J-H, Kleinman A, Lawler JM, Lee JA, Limoli CL, McDonald JT, Mieczkowski J, Muratani M, Najjar D, Othman MA, Overbey EG, Paar V, Park J, Paul AM, Perdyan A, Proszynski J, Reynolds RJ, Ronca AE, Rubins K, Rutter LA, Ryon KA, Sanders LM, Glowe PS, Scott RT, Shirah B, Sienkiewicz K, Siew K, Theriot CA, Tierney BT, Venkateswaran K, Hirschberg JW, Walsh SB, Winer DA, Yu M, Zea L, Mateus J, Beheshti A. "A second space age spanning omics, platforms, and medicine across orbits." Nature. 2024 Aug;632(8027):995-1008. https://doi.org/10.1038/s41586-024-07586-8 ; PMID: 38862027 , Aug-2024

Articles in Peer-reviewed Journals	Kamal KY, Othman MA, Kim JH, Fluckey JF, Lawler JM. "Bioreactor development for skeletal muscle hypertrophy and atrophy by manipulating uniaxial cyclic strain: Proof of concept. " npj Microgravity. 2024 Jun 11;10:62. https://doi.org/10.1038/s41526-023-00320-0 ; PubMed PMID: 38862543; PubMed Central PMCID: PMC11167039 , Jun-2024
Articles in Peer-reviewed Journals	Hord JM, Garcia MM, Farris KR, Guzzoni V, Lee Y, Lawler MS, Lawler JM. "Nox2 signaling and muscle fiber remodeling are attenuated by losartan administration during skeletal muscle unloading." Physiol Rep. 2021 Jan;9(1):e14606. https://doi.org/10.14814/phy2.14606 ; PubMed PMID: 33400850; PubMed Central PMCID: PMC7785102 , Jan-2021
Articles in Peer-reviewed Journals	Wu CS, Wei Q, Kim DM, Balderas M, Wu G, Lawler J, Safe S, Devaraj S, Chen Z, Sun Y. "Protective effects of ghrelin on fasting-induced muscle atrophy in aging mice." J Gerontol A Biol Sci Med Sci. 2020 Mar 9;75(4):621-630. https://doi.org/10.1093/gerona/gly256 ; PubMed PMID: 30407483; PubMed Central PMCID: PMC7328200 , Mar-2020
