Key Personnel Changes/Previous PI:	0		
COI Name (Institution):	Gabriel, T. (Independent Consultant) Gabriel, T. (Independent Consultant)		
Grant/Contract No.:	NAG8-1669		
Performance Goal No.:			
Performance Goal Text:			
Task Description:	Develop a radiation transport code system for HEDS applications, based on Monte Carlo methods, that is state-of-the-art in terms of physics models, transport methodologies, and capabilities. To develop a radiation transport code system for HEDS. This transport method (Monte Carlo) has inherent capabilities – namely 3D transport, modular programming and detailed output – that are important for HEDS applications. The new radiation transport code will provide a near-term computational tool with reduced uncertainties for HEDS radiation issues.		
Rationale for HRP Directed Research:			

Research Impact/Earth Benefits:	HETC code can also be used for accelerator beam characterization and shielding studies.
Task Progress:	1. The HETC code has been modified for heavy ion transport by developing and incorporating the appropriate transport modules into the code. The initial heavy ion event generator incorporating the nuclear models used to describe the interactions and breakup of the incident beam nuclei has been developed and incorporated into the HETC code. Code validation has been initiated by comparing predicted fluences of heavy ion species (incident beams and secondaries) with laboratory measurements obtained by NASA funded research studies at the Brookhaven National Laboratory. Agreement between code predictions and laboratory measurements for fragment fluences near the incident beam direction is good for targets as thick as 10 g/cm2. There are some increasing differences noted at 10 g/cm2, but further comparisons with other data are needed to establish if the disagreement is due to data errors or problems with the code predictions. Code testing and refinement are continuing under the auspices of NASA Grant No. NAG 8-1901, which continues the work begun under the current task. 2. A University of Tennessee Ph.D. student, funded for the last 2.5 years of this grant by a NASA Graduate Student Researcher Program Fellowship, undertook the development of the heavy ion event generator as part of his Ph.D. dissertation requirements, under the supervision of the PI. The initial version of the event generator has been developed, debugged, and incorporated into the HETC code. Code and event generator testing, validation and benchmarking has begun. The main shortcomings in the prersent event generator are the need for an improved treatment of secondary neutrn production and the need to incorporate meson production from nucleus-nucleus collisions. 3. Further work on this task is being carried out under the auspices of NASA Grant No. NAG 8-1901.
