Fiscal Year:	FY 2016	**Task Last Updated:**	FY 05/03/2016
PI Name:	Ploutz-Snyder, Lori L. Ph.D.		
Project Title:	Integrated Resistance and Aerobic Training Study (Sprint)		
Division Name:	Human Research		
Program/Discipline:	HUMAN RESEARCH		
Program/Discipline--Element/Subdiscipline:	HUMAN RESEARCH--Biomedical countermeasures		
Joint Agency Name:		**TechPort:**	No
Human Research Program Elements:	(1) **HHC**:Human Health Countermeasures		
Human Research Program Risks:	None		
Space Biology Element:	None		
Space Biology Cross-Element Discipline:	None		
Space Biology Special Category:	None		
PI Email:	lorips@umich.edu	**Fax:**	FY
PI Organization Type:	UNIVERSITY	**Phone:**	(734) 764-5210
Organization Name:	University of Michigan		
PI Address 1:	OBL 4170, 1402 Washington Hts.		
PI Address 2:	School of Kinesiology		
PI Web Page:			
City:	Ann Arbor	**State:**	MI
Zip Code:	48109-2013	**Congressional District:**	12
Comments:	Previously at Universities Space Research Association/NASA Johnson Space Center until July 2016.		
Project Type:	Flight	**Solicitation / Funding Source:**	Directed Research
Start Date:	10/01/2009	**End Date:**	09/30/2016
No. of Post Docs:	0	**No. of PhD Degrees:**	2
No. of PhD Candidates:	2	**No. of Master' Degrees:**	0
No. of Master's Candidates:	0	**No. of Bachelor's Degrees:**	0
No. of Bachelor's Candidates:	0	**Monitoring Center:**	NASA JSC
Contact Monitor:	Norsk, Peter	**Contact Phone:**	
Contact Email:	Peter.norsk@nasa.gov		
Flight Program:	ISS		
Flight Assignment:	ISS NOTE: Project at JSC ended and continued by Integrated Resistance and Aerobic Training Study (Sprint)--NNX16AO74G, per HRP and PI (Ed., 10/30/18) NOTE: Risk/Gap changes per IRP Rev E (Ed., 3/20/14) NOTE: change in end date to 5/14/2021 per HRP MTL 11/11/11 (Ed., 12/22/11) NOTE: project title changed to "Integrated Resistance and Aerobic Training Study (Sprint)" per PI/JSC (7/2010) NOTE: change in end date to 6/1/2020 (from 9/30/15) per JSC (3/2010)		
Key Personnel Changes/Previous PI:	no changes		
COI Name (Institution):	Trappe, Scott Ph.D. (Ball State University) Ploutz-Snyder, Robert Ph.D. (Universities Space Research Association) Guilliams, Mark (Wyle) Martin, David M.S. (Wyle)		
Grant/Contract No.:	Directed Research		
Performance Goal No.:			

Performance Goal Text:	
Task Description:	Current exercise countermeasures are insufficient to prevent muscle atrophy, cardiovascular deconditioning, and bone loss associated with long-duration spaceflight. A known limitation has been the inability of the International Space Station (ISS) exercise hardware to provide sufficient loads to the human body that are required for maintaining physiological function. New flight exercise hardware, including the advanced resistance exercise device (ARED) and 2nd generation treadmill (T2), are designed to provide astronauts with the ability to exercise at higher intensity. This opens an array of new possibilities for exercise programming in long-duration spaceflight. While the ability to do resistance exercises at heavier loads, the ability to run faster and potentially with more body loading are obvious improvements in exercise capabilities, the details of how this new equipment should be used are not so obvious. Towards this end, two workshops were held, the NASA Muscle Workshop in June 2008 and the NASA International Space Station Exercise Prescription Workshop in October 2008. Intramural and extramural experts concluded that using higher intensity resistance exercises and interval aerobic exercise would help to maintain physiological function while simultaneously decreasing total exercise time and volume. The panel then recommended that this evidence-based approach to the development of a novel exercise prescription for use on ISS should immediately be proposed. Therefore the purpose of this research is to evaluate the efficacy of a new integrated resistance and aerobic training (iRAT) program designed to minimize loss of muscle, bone, and cardiovascular function during ISS missions. Highlights of the iRAT include an increase in the intensity and a reduction in the volume of resistance exercises, inclusion of very short, but high intensity interval-type aerobic exercises, and starting the exercise countermeasures as early as possible in the flight, preferably in the first week. Pre-, in-, and post-flight testing, and data sharing with selected on-going medical assessment tests, will be used to assess the effectiveness of this candidate prescription. Tests include detailed measurements of lower body muscle structure and function (MRI, ultrasound, muscle performance testing, shared muscle medical tests), maximal aerobic capacity, ventilatory threshold, left ventricular mass and cardiac contractility, and bone mineral density. Twenty (20) long duration crew members will be recruited as active subjects in iRAT; and 20 will be asked to serve as controls that perform the standard care exercise prescription and the pre-post flight testing. This proposal is sponsored by the Exercise Physiology and Countermeasures Project and directly addresses the Human Research Program (HRP) Integrated Research Plan (IRP) Risks of Impaired Performance Due To Reduced Muscle Mass, Strength and Endurance and Risk of Reduced Physical Performance Capabilities Due To Reduced Aerobic Capacity, and Risk of Accelerated Osteoporosis. This proposal addresses Gap M7: Can the current in-flight performance be maintained with reduced exercise volume? The proposal addresses IRP Gap M8 (What is the minimum exercise regimen needed to maintain fitness levels for operationally relevant tasks?) and Gap M9 (What is the minimum set of equipment needed to maintain those (M8) fitness levels?).
Rationale for HRP Directed Research:	This research is directed because it contains highly constrained research, which requires focused and constrained data gathering and analysis that is more appropriately obtained through a non-competitive proposal.
Research Impact/Earth Benefits:	Development of more efficient exercise programs could be used on Earth. A more thorough understanding of how cardiovascular, skeletal muscle, and bone health is affected by exercise.
Task Progress:	Exercise is the primary countermeasure to protect against these changes and was made operational before completely mature; research continues to identify most effective/efficient exercise programs. Crew medical tests (cardio, muscle, bone) do not yield sufficient information to fine tune the effectiveness of exercise programs; thus, there is a need for more detailed testing aimed at identifying the most effective training program. Ground research clearly indicates that exercise intensity is the most important factor related to maintenance of fitness. SPRINT is based on several main factors: • Higher intensity, less frequent resistance exercise; • More variety of resistance exercises; • Alternate days of moderate intensity continuous aerobic exercise with higher intensity interval aerobic exercise ; • Monitor in-flight exercise performance using instrumented hardware ; • Include more robust physiological outcome measurements to document the efficacy of the exercise program. There are 2 primary objectives to SPRINT: • Obtain detailed information about crew physical fitness pre-, in-, and post-flight. – Participation involves pre-, in-, and post-flight testing (modifications to standard medical & new tests). ; – Standard medical tests are only descriptive and do not provide enough information to understand why an exercise program was or was not effective. • Evaluate new evidence based exercise prescription with higher intensity, lower duration, and frequency. 8 of 12 subjects have been enrolled in the active portion of the study. Five control subjects have been enrolled.
